OTTENS ET AL. -- 10/736,988 Client/Matter: 081468-0307259

IN THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A lithographic projection apparatus comprising: an illumination system to provide a beam of radiation;

an article support to support an article <u>having at least one edge</u> to be placed in a beam path of said beam of radiation; and

a clamp to clamp said article to said article support,

wherein said clamp is provided with a plurality of zones located <u>substantially</u> continuously around a circumference of said article support to create a locally adjusted pressure so as to provide a local bending moment <u>near the edge of said article</u> to locally bend said article.

- 2. (Original) A lithographic projection apparatus according to claim 1, wherein said article support comprises at least three support pillars.
- 3. (Original) A lithographic apparatus according to claim 2, wherein said article support consists of three pillars.
- 4. (Original) A lithographic apparatus according to claim 2, wherein said article support consists of four support pillars.
- 5. (Original) A lithographic apparatus according to claim 2, wherein said support pillars are actuable.
- 6. (Original) A lithographic apparatus according to claim 5, wherein said support pillars are piezo-pads.

OTTENS ET AL. - 10/736,988 Client/Matter: 081468-0307259

7. (Original) A lithographic apparatus according to claim 1, wherein at least one of said plurality of zones comprises an individually controllable clamp.

- 8. (Original) A lithographic apparatus according to claim 7, wherein said clamp comprises a height sensor to sense a local height of the article.
- 9. (Original) A lithographic apparatus according to claim 1, further comprising a clamp control unit to adjust the clamping pressure of said plurality of zones to attain a leveled article.
- 10. (Original) A lithographic apparatus according to claim 9, wherein said clamp control unit is configured to control said clamping pressure in response to at least one of a detected local height of said article and a detected image quality.
- 11. (Original) A lithographic apparatus according to claim 1, wherein said plurality of zones comprise sectioned pressure zones to create a relatively differing backfill gas pressure.
- 12. (Original) A lithographic apparatus according to claim 1, wherein said article comprises a reticle.
- 13. (Currently Amended) An article support to support a flat article <u>having at</u> <u>least one edge</u> to be placed in a beam path of radiation, said article support comprising:

a clamp to clamp said article to said article support,

wherein said clamp is provided with a plurality of zones located <u>substantially</u> <u>continuously</u> around a circumference of said article support to create a locally adjusted pressure so as to provide a local bending moment <u>near the edge of said article</u> to locally bend said article.
